## brainOS 4.2

If you didn't have enough storage to download the latest brainOS update, like most of us, you're may be concerned about what is going to happen next. There has been a lot of speculation about the recent update, particularly around Wifi and Bluetooth compatibility issues. Now, it seems that the sophisticated connection channels are only accessible with users who have downloaded the new update.

The first red flag came up after the update two weeks ago, many people experienced difficulty connecting to devices they needed at work, such as MindKinnect and CoinXchange, which allow workers to pair up with their clients for idea or currency transfers. The uproar that occurred when those workers were laid off sparked the Grey Minds Matter Movement, which has been gaining more momentum since the initial protests in Portland. Those Luddites who refuse to have any installation of brain hardware, are no longer a minority among those who either refuse or cannot afford to keep updating.

According to a recent survey, approximately 93% of the population, with at least some brainware installed, have not been able to participate in two or more years worth of updates. In fact, it appears that the only group that can afford the exabyte of storage capacity needed in order to download the most recent updates are among the top 2% of the elite. There are rumors that those of the elite who have updated are able to connect from around the world as easily as if they were standing next to each other.

With updates every two weeks, at roughly \$1.99 bitcoins each, people are less likely to update every time. When there were yearly rather than biweekly updates, it was not so difficult for people to update. Of course, 2017 was the age of External iOS right before the cusp of

brainOS in 2022. People expected a Kurzweilian future where OS became exponentially more advanced while remaining inexpensive. Who could have predicted that brainware would become so expensive and entirely eradicate the use of artificially intelligent beings?

Instead we have an elite that produce and consume information amongst each other. They work entirely among each other, and have become almost entirely impossible to communicate with since their OS uses a language outside of spoken or coding that can be translated thus far. Those without the resources simply cannot participate and have less opportunities to engage in our computer-dominant society. Not to say that there are no jobs for the simple brainOS users. Somehow there is always a new emoji to invent or children's app to design. It doesn't pay as well as thought-guiding engineers, but I can't afford to download those kinds of apps anyway.
