Biophysics and Systems Biology Seminar Series

Ned Wingreen, Ph.D.

Associate Director Lewis-Sigler Institute for Integrative Genomics, Princeton

"Protein phase transitions in and out of cells"

Abstract:

Biologists have recently come to appreciate that eukaryotic cells are home to a multiplicity of non-membrane bound compartments, many of which form and dissolve as needed for the cell to function. These dynamical "condensates" enable many central cellular functions – from ribosome assembly, to RNA regulation and storage, to signaling and metabolism. While it is clear that these compartments represent a type of separated phase, what controls their formation, how specific biological components are included or excluded, and how these structures influence physiological and biochemical processes remain largely mysterious. I will discuss recent experiments on phase separated condensates both in vitro and in vivo, and will present theoretical results that highlight a novel "magic number" effect relevant to the formation and control of two-component phase separated condensates.

Thursday, February 8, 2018 at 10:00AM Natural Sciences 2, Room 1201

Hosts: Matt Bovyn, mbovyn@uci.edu, and Dr. Albert Siryaporn, asirya@uci.edu.

If you're interested in meeting with Dr. Wingreen, please contact Dr. Siryaporn.
